

ABSTRACT

An automated banking machine (10) includes a user interface (15) and a cash dispensing mechanism (220). A fascia of the machine (12) includes a pair of horizontally disposed convex mirrors (338, 340) which enables viewing an area (343) behind the user of the machine. Sensors
5 are operative to determine when a mirror requires cleaning and to cause the mirror to be cleaned either by actuating a cleaning device and/or by contacting a remote servicer. Lights may be selectively directed and illuminated to reduce the risk of observation of inputs to the machine by unauthorized persons.
